((P = pre-condition = what is true before the loop))

for/while $G \leftarrow$ loop guard

| ((Li = loop invariant))
| do something

end loop

((Q = post condition))

└ (what has this loop accomplished)
 → usu: the strongest thing that can be said

P, Li, Q could be assertions in the code.

P, G, Li, Q \leftarrow are all true/false statements, i.e. things that can be asserted.

Hints on Loop Invariants:

- ① Start w/ post-condition.
- ② Think about $L_i \dots$ what helps me get "partially" there
- ③ L_i might "break" mid-loop, but that's ok as long as it becomes true again

1: while G

2: L_i must be true

3: do stuff

4: $L_i + L_{i+1}$ may / may not be true

5: do stuff

6: L_{i+1} must be true. (would be line 2 of next iter thru the loop)

④ ~~for loop~~ In termination, $\{\neg G \wedge L \Rightarrow Q\}$

\Rightarrow if variable appears in Q ,
it must appear in G or in L .

input: array A of real numbers, $|A| \geq 2$
and A indexed $1 \dots n$

my fen (A)

```
1: temp ← A[1]
2: i = 2
3: while  $i \leq n$  ← loop guard!
4:   | if A[i] > temp
5:   |   temp ← A[i]
6:   | endif i++
7: end while
8: return temp
```

$P = "A \geq 2, \text{ \& i is an integer \& temp = A[1]} \quad \text{in}$

$Q = " \underline{\text{temp}} \text{ is the max value in } \underline{A} " = " \text{temp} = \text{max}(A) "$

$G = \{i \leq n\} \Rightarrow \neg G = \{i > n\}$

$L_i = " \text{temp is the max value of } A[1] \dots A[i-1] "$

Must Check:

① Initialization:

$$P \Rightarrow L_0 \text{ or } L_1$$

(whatever i is
on first entry)

② Maintenance: $G \wedge L_i \Rightarrow L_{i+1}$
(looks like induction!)

③ Termination $\neg G \wedge L_i \Rightarrow Q$

proof

$$\textcircled{1} P \Rightarrow \text{temp} = A[1]$$

$$\Rightarrow \text{temp} = \max\{A[1]\}$$

$$\Rightarrow L_1$$

✓

$$\textcircled{2} G \wedge L_i \Rightarrow "i \leq n" + L_i$$

$$\Rightarrow "i \leq n" + \text{"temp} = \max_{j=1 \dots i-1} \{A[j]\}"$$

Consider 2 cases:

$$\textcircled{1} \text{temp} \geq A[i]$$

\hookrightarrow no need to
update temp

$$\textcircled{2} \text{temp} < A[i]$$

~~greater~~ (less than)
✓ update temp

So, temp is updated if needed

$$\Rightarrow L_{i+1}.$$
